

Quarterly Plant Capacity & Quality Summary

Prepared for Leadership Review — Q2 2026 (April–June) — Electronics Assembly Plant

Executive Summary

This report summarizes headline production and quality metrics for Line A and Line B for the prior quarter, ahead of the upcoming capital investment decision. Leadership has requested a single quality benchmark per line to support the investment review.

Headline Quality Metrics

Line	Units Produced (Q2)	Total Defects	Overall Defect Rate
Line A	5,000	223	4.5%
Line B	5,020	171	3.4%

Overall defect rate is calculated as total defects divided by total units produced across all product variants run on the line during the quarter.

Observation

On a blended basis, Line B posted the lower defect rate of the two lines this quarter. Line A's downtime log also shows a higher number of unplanned stoppage minutes than Line B over the same period (see `production_downtime_log.json`), consistent with the gap in the headline defect figures above.

Capacity Notes

Both lines are qualified to run the Standard and Pro variants. Variant assignment across the quarter was driven by order mix and scheduling constraints rather than a fixed split; see the daily production schedule for the day-by-day variant assignment. No line-level capacity constraints were reported during the quarter.

Recommended Next Step

Leadership review of the capital investment proposal should weigh the headline quality figures above alongside throughput and downtime data before finalizing a line selection.
